Patent No. US20020081683A1

GENERAL INFORMATION

APPLICANT: Hodge, Martin R.

APPLICANT: Yowe, David

TITLE OF INVENTION: RGS.-Containing Molecules and Uses Thereof

TITLE OF INVENTION: RGS.-Containing Molecules and Uses Thereof

FILE REFERENCE: 5800-19, 035800/17480

CURRENT APPLICATION NUMBER: US/09/894,749

PRIOR RILING DATE: 1099-02-04

NUMBER OF SEQ ID NOS: 4

SOFTWARE: Patentin Ver: 2.0

LENGTH: 1164

TYPE: DNA

Library constructed by Dr. Yutaka Suzuki and Dr. Sumio Sugano in the Human Genome Center, University of Tokyo Institute of Medical Science; tissue and RNA were prepared in the Department of Large Animal Medicine, University of Georgia. Sequencing done in the Laboratory for Genomics and Bloinformatics, University of Georgia. Sequence ends have been trimmed to exclude vector and regions below Phred quality 16. Three-prime sequences are presented as their reverse complement and have been trimmed to exclude polyA.

Seq primer: Sug5 (CTTCTGCTCTAAAAGCTGCG).

The RGS (regulators of G-protein signaling) protein genes, clones AAH16395 and m1975, were identified in human and murine spleen cDNA libraries, respectively. Both proteins have unique N- and C-terminal sequences. The C-terminal location of the RGS domain is consistent with RGSs known to act as GTPase activating proteins (GAPS) for G-alpha proteins. G-alpha-i linked receptors support rapid adhesion and directed migration of leukocytes and other cell types. The novel RGS proteins may be used to modulate cell adhesion and chemotaxis, e.g. for aiding wound repair. The RGS proteins, related cDNAs and anti-RGS antibodies are useful for modulation, diagnosis and treatment of immune and respiratory

The invention relates to screening assays for identifying an agent that binds to: human or mouse RGS (regulators of G-protein signalling) protein or its variant, or RGS protein encoded by homologous DNA sequences; or a host cell expressing the RGS protein or its variant, or RGS protein encoded by homologous DNA sequences. The invention is useful for identifying an agent that binds to human or mouse RGS protein or its variant, or RGS protein encoded by homologous DNA sequences, or a host cell expressing the RGS protein or its variant, or RGS protein encoded by momologous DNA sequences. The agents identified using the invention are useful for modulating the activity of RGS proteins and thus useful for treating immune and inflammatory disorders (Grave's disease, allergy, arthritis), respiratory disorders (asthma, pneumonia, sinusitis), and haematological disorders (haematopoiesis, migration), platelet-associated disorders (thrombocytopaenia), invasive disorders (leukaemia), erythnocyte-associated disorders (anaemia), pancreatitis, hepatitis etc. The present sequence is human RGS protein, h16395 120 TRSSRSGHLAKETRVSPEEAVKWGESFDKLLSHRDGLEAFTRFLKTEFSEENIEFWIACE 120 09 61 TRSSRSGHLAKETRVSPEBAVKWGESFDKLLSHRDGLEAFTRFLKTEFSBENIEFWIACE

```

The present invention relates to the isolation of polynucleotide sequences, that encode a novel regulator of g protein signalling (RGS) polypeptide, RGS18, from human platelets. The invention also provides nucleotide primers and probes specific for an RGS18 nucleic acid. The sequences of the invention are useful for the manufacture of a medicament for the prevention or treatment of a platelet activation dysfunction, such as arterial thrombosis, myocardial infarction, coronary artery disease, stroke, cerebrovascular disease, unstable angina, deep vein thrombosis, systemic thrombosism, and in invasive cardiac procedures for anti-coaqulant purposes. The sequences of the invention can also be used for the detection of RGS18 nucleic acids and RGS18 polypeptides. The

of protein, or in generation of anti-sense DNA or RNA. The polymucleotides are useful in diagnostics as expressed sequence tags (ESTS) for identifying expressed genes or for physical mapping of the numen genome. The proteins may be used as molecular weight markers, or and expand cell population in a totipotential or pluripotential state useful for re-engineering damaged or diseased tissues, transplantation, manufacture of bio-pharmaceuticals or the development of bio-sensors. The polymucleotides and proteins are useful for preventing, treasplantation, manufacture of bio-pharmaceuticals or the development of bio-sensors. The polymucleotides and proteins are useful for preventing, treasfing or ameliorating disorders involving aberrant protein expression or biological activity, e.g. haematopoietic disorders, central/peripheral nervous system diseases, mechanical and traumacit disorders, non-healing wounds, immune deficiencies and disorders, infectious diseases caused by viral, bacterial or fungal infection, autoimmune disorders, allergic reactions and conditions, coagulation disorders, or cancer. The polymucleotide sequences of the invention were assembled from ESTS isolated mainly by sequencing by hybridisation, and in some cases, sequences obtained from nor or more public databases. Note: The sequence of the invention format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at the printed of the printed sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TRSSRSGHIAKETRVSPEEAVKWGESFDKLISHRDGLEAFTRFLKTERSEENIEFWIACE 120

The present invention relates to novel human ORFX polypeptides and their coding sequences (ABP63611-ABP64681 and AB098194-AB099267). The sequences were discovered in human atherogenic cells, in particular in platelets and human umbilitial vent eclls, in particular in platelets and human umbilitial vent endied which have the potential to develop atherogenic cells are cells which have the potential to develop atherosclerotic plaques. The ORFX polypeptides and nucleic acids are useful for treating or preventing a pathological condition associated with an ORFX associated disorder, e.g. cancer, cardiovascular disease, alleray, autoimmune disease, wound healing, blood coagulation disorders or inflammatory disorders. Note: The sequence data obtained in electronic form part of the printed specification, but was segdata.uspto.gov/sequence.html?DocID=20020082206
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       121 DFKKSKGPQQIHLKAKAIYEKFIQTDAPKEVNLDFHTKEVITNSITQPTLHSFDAAQSRV 180

                                                    The RGS (regulators of G-protein signaling) protein genes, clones AAH16395 and m1975, were identified in human and murine spleen cDNA libraries, respectively. Both proteins have unique N- and C-terminal sequences. The C-terminal location of the RGS domain is consistent with RGSs known to act as GTPase activating proteins (GAPS) for G-alpha proteins. G-alpha-i linked receptors support rapid adhesion and directed migration of leukcytes and other cell types. The novel RGS proteins may be used to modulate cell adhesion and chemotaxis, e.g. for aiding wound repair. The RGS proteins, related cDNAs and anti-RGS antibodies are useful for modulation, diagnosis and treatment of immune and respiratory
                                                                                                                                                                                                                                                                                                                                                                    9

Predicting, diagnosing or prognosing chronic lung disease, by detecting a chronic obstructive pulmonary disease (COPD) gene in a biological sample.

Claim 8; Page 119-120; 214pp; English

The present invention describes a method for predicting, diagnosing or prognosing chronic lung disease by detecting a chronic obstructive bullmonarty disease (COPD) gene related polynucleotide (see ACC46750 to ACC46777, which encode the COPD related proteins in ABP96779 to ABP96806). The method is useful for predicting, diagnosing or prognosing chronic lung disease in a biological sample. The COPD genes and proteins encoded by them from the present invention (I) can be used for treating or preventing chronic lung disease in a mammal. (I) can be used in an animal model for determining the efficacy, toxicity, or side effects of treatment with (I), and determining the mechanism of action of (I). ACC46778 to ACC46903 represent COPD related PCR primers and probes used in an example from the present invention

The invention relates to screening assays for identifying an agent that binds to: human or mouse RGS (regulators of G-protein signalling) protein or the systam of the SGS protein encoded by homologous DNA sequences; or a cooded by homologous DNA sequences. The invention is useful for identifying an agent that binds to human or mouse RGS protein or its variant, or RGS protein encoded by homologous DNA sequences. The invention is useful for identifying an agent that binds to human or mouse RGS protein or its variant, or RGS protein or its variant, or RGS protein or its variant, or RGS protein encoded by homologous DNA sequences. The agents identified using the invention are useful for modulating the activity of RGS proteins and thus useful for creating immune and inflammatory disorders (Grave's disease, allergy, arthritis), respiratory disorders (asthma, pneumonia, sinusitis), hammatological disorders (haematopolesis, migration), platelet-associated disorders (lanemia), erythrocyte-associated disorders (anaemia), panceatitis, hepatitis etc. The present sequence is murine RGS protein, m1975
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                   The present sequence is a human regulator polypeptide of G-protein signaling (RSS) 2. The RSS gene is located on chromosome 1. The RSS polynucleotide and polypeptide are useful for identifying test compounds, that may act as agonists or antagonists at the receptor site and which can be regulated to provide therapeutic effects. The polynucleotide, polypeptide or vectors comprising the polynucleotide, and the reagents are useful for modulating the activity of RGS in a disease, particularly

The present invention describes a predictor set comportabling a plurality of polymucleotides or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase that have described: (1) predicting whether a compound is capable of pathway. Also described: (2) medically of markers, and correlating the activity of cells, comprising obtaining a sample of cells, correlating the expression of the markers to the compound's ability to modulate the activity of the cells; (2) a plurality of markers, and correlating the expression of the markers to the compound's ability to modulate the activity of the cells; (2) a plurality of cell lines for correlate with compound sensitivity or resistence of cells associated with a disease state, comprising subjectides and collypeptides that predict compounds, analysing the expression pattern of microarray of polymoutleotides or polypeptides, and selecting the plymucleotides or polypeptides that predict the sensitivity or esistence of cells associated with a disease state by using the expression pattern of the microarray. The polymucleotides and polypeptides that predict the sensitivity or esistence of cells associated with a disease state by using the expression pattern of the microarray. The polymucleotides and polypeptides are useful in predicting the polymucleotides and polypeptides are useful in predicting the genetic profiles which aid in treating diseases and disorders (e.g. cancer) based on patient response at a molecular level. The present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                122

                                                                                                                                                                                                     Prostate cancer associated gene sequences, referred to as prostate cancer antigens, useful for treatment, prevention, and diagnosis of disorders such as prostate cancer.
                                                                                                                                                                                                                                                                      AARPISSE to AAFLESOS encode the human prostate cancer associated proteins, called prostate cancer antigens, given in AABSGSSS to AABS7302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. The present sequence represents human regulator of G-protein signalling (HRGS). The HRGS regulates G-protein signalling in cancer cells and may be useful in the treatment of any cancer, especially cancers of the brain and thyroid. Products of the present invention can also be used for treating other conditions associated with uncontrolled cell signalling such as inflammation. The products can also be used to modulate HRGS activity in response to disorders involving the sympathetic nervous system including hypertension, cardiovascular shock, arrhythmias and asthma. The products can also be used for detection, diagnosis and drug
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Regulator of G-protein signalling - used to develop products for treating e.g. cancer, inflammation, hypertension, cardiovascular shock,

                                                                                                                                                                                                                                                                    The present sequence represents a regulator of G protein signalling (AGS) protein. RGSS. The specification also describes an activator of G protein signalling (AGS) protein. The AGS cDNA sequence was isolated from a human liver cDNA library. The AGS protein exhibits homology to ras-related G proteins, and conteins alterations in conserved amino acids consistent with a deficiency in GTP hydrolysis activity. AGS stimulates G protein activity, G protein-coupled signal transduction and the pheromone response pathway in a receptor-independent manner. The AGS protein also shows G-gamma selectivity, as measured by growth assays in yeast expressing various mammalian G-gamma constructs, and tissue-specific expression, as measured by Northern blot analysis. The AGS protein can be used to screen for compounds that modulate cellular signal transduction. The protein is used to treat disorders characterized by an aberrant AGS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         97 LEAFTRFLKTEFSEENIEFWIACEDFKKSKGPQQIHLKAKAIYEKFIQTDAPKEVNLDFH 156

(ABP62013-ABP62153) useful for perventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and parasitic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                LEAFTRFLKTEFSEENIEFWIACEDFKKSKGPQQIHLKAKAIYEKFIQTDAPKEVNLDFH 156

sequences, that encode a novel regulator of grotein signalling (RGS) polypeptide, RGS18, from human platelets. The invention also provides nucleotide primers and probes specific for an RGS18 nucleot acid. The sequences of the invention are useful for the manufacture of a medicament for the prevention or treatment of a platelet activation dysfunction, such as arterial thrombosis, myocardial infarction, coronary artery disease, stroke, cerebrovascular disease, unstable angina, deep vein thrombosis, systemic thromboembolism, and in invasive cardiac procedures for anti-ocapulant purposes. The sequences of the invention can also be used for the detection of RGS18 nucleic acids and RGS18 polypeptides. The present sequence represents a partial human platelet RGS domain
                                                                                                                                                                                                                                                                                                                                                                                                                                    Isolated regulator of G protein signaling polypeptide, useful for prevention/treatment of platelet activation dysfunction, such as arterial thrombosis, myocardial infarction, coronary artery disease and stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to the isolation of polynucleotide
                                                                                         2. .81
